

AI Test Results from testers.ai

The SmartBear app's HOME page is facing some serious quality headwinds. We're seeing a disturbing number of security vulnerabilities, evidenced by the numerous CORS policy violations and outdated jQuery library. Accessibility is also a major concern, with issues like insufficient color contrast in the cookie banner and missing alt text for hub icons. These factors significantly degrade the user experience and trustworthiness of the app.

<p>Best Aspects</p> <p>The app has the potential to provide valuable functionality, but its current state is overshadowed by critical security and accessibility problems.</p>	<p>Areas for Improvement</p> <p>Major security vulnerabilities (CORS violations, outdated jQuery), serious accessibility issues (insufficient color contrast, missing alt text), and privacy concerns (unclear data retention policies).</p>

Quality Summary

[View Detailed Report](#)

Detailed Analysis

The SmartBear app presents a mixed bag of quality signals, especially on the HOME page. The sheer volume of bugs, currently at 15, is alarming. A concerning trend revolves around security vulnerabilities, with multiple CORS policy violations and an outdated jQuery library creating potential attack vectors. Furthermore, privacy concerns surface due to unclear data retention policies and a lack of centralized explanation for third-party privacy policies.

On the accessibility front, the app struggles with fundamental issues. Insufficient color contrast in the cookie banner and missing alt text for hub icons create barriers for users with disabilities, demonstrating a lack of attention to inclusive design. Usability is also hampered by ambiguous link text like "Learn more" without adequate context.

While there isn't any direct user feedback to suggest the application type, the variety of bugs indicates this could be a general tool app that is trying to integrate several different technologies, and its likely suffering from technical debt.

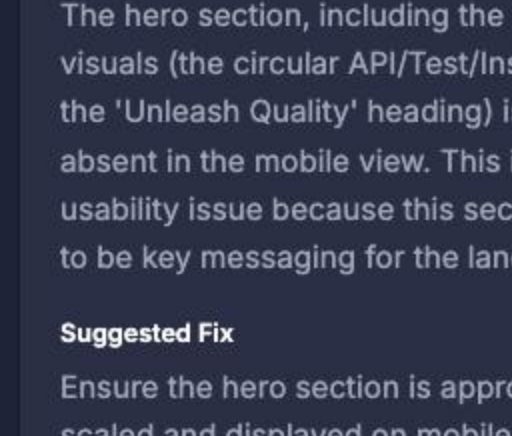

Key Suggestions

- Conduct a thorough security audit to identify and address all vulnerabilities.
- Implement a comprehensive accessibility testing strategy to ensure compliance with WCAG guidelines.
- Review and update data retention policies to comply with GDPR and other privacy regulations.
- Improve color contrast and add alternative text to all images and icons.
- Refactor code to address the high number of bugs on the home page.

Priority Improvements

- Update the jQuery library to the latest secure version.
- Implement proper CORS configuration to prevent cross-origin vulnerabilities.
- Ensure all UI elements meet WCAG color contrast guidelines, especially the cookie banner.
- Add descriptive alt text to all hub icons to improve accessibility.
- Clarify data retention policies and provide a clear user data deletion option in compliance with GDPR.
- Replace ambiguous link text like "Learn more" with more descriptive alternatives.

Issues Found by AI Testers

<p>Adeela Mobile Responsive Tester</p> <p>Missing Hero Section on Mobile</p> <p>Priority: 9/10 Confidence: 9/10</p> <p>general layout</p> <p>Why is this a bug?</p> <p>The hero section, including the primary visuals (the circular API/Test/Insight hubs, and the 'Unleash Quality' heading) is completely absent in the mobile view. This is a major usability issue because this section appears to be key messaging for the landing page.</p> <p>Suggested Fix</p> <p>Ensure the hero section is appropriately scaled and displayed on mobile devices. Implement responsive design to adjust the layout and size of elements within the hero section.</p> <p>Why Fix This?</p> <p>The hero section contains essential marketing information and call-to-actions. Its absence degrades the user experience and negatively impacts engagement.</p> <p>Route To</p> <p>Frontend Engineer</p>	<p>Jason AI Tester</p> <p>CORS Policy Violation for integrate.com API</p> <p>Priority: 8/10 Confidence: 9/10</p> <p>network security</p> <p>Why is this a bug?</p> <p>The CORS policy violation indicates that the server at 'https://api.integrate.com' is not correctly configured to allow cross-origin requests from 'https://smartbear.com'. The 'Access-Control-Allow-Origin' header contains multiple values, which is invalid. This prevents the client-side JavaScript code from accessing the API, potentially breaking functionality that relies on that API.</p> <p>Suggested Fix</p> <p>Correct the CORS configuration on the 'https://api.integrate.com' server. The 'Access-Control-Allow-Origin' header should either be set to a single origin ('https://smartbear.com') or to '*' if the API is intended to be publicly accessible. However, using '*' can have security implications, so it's generally recommended to specify the allowed origins explicitly. Also check if the service is using an outdated configuration.</p> <p>Why Fix This?</p> <p>Features that rely on the 'integrate.com' API will be broken, resulting in a degraded user experience.</p> <p>Route To</p> <p>Backend Engineer/Security Engineer</p>	<p>Adeela Mobile Responsive Tester</p> <p>Missing Navigation Bar elements on Mobile</p> <p>Priority: 9/10 Confidence: 9/10</p> <p>general layout</p> <p>Why is this a bug?</p> <p>The full navigation bar (Products, Solutions, Resources, Careers, etc.) visible on the desktop version is not present in the mobile version. While a hamburger menu exists, it obscures a primary navigation bar that would allow the user to quickly find the products and solutions offered. The absence of direct navigation links significantly hampers the mobile user experience.</p> <p>Suggested Fix</p> <p>Implement a responsive navigation menu that adapts to mobile screens without obscuring the landing page elements. A collapsible menu or a simplified version of the navigation bar could be used.</p> <p>Why Fix This?</p> <p>The missing navigation bar severely limits the user's ability to explore the website and find relevant information.</p> <p>Route To</p> <p>Frontend Engineer</p>

Multiple ERR_NAME_NOT_RESOLVED errors

Priority: 7/10 Confidence: 8/10

network performance

Why is this a bug?

Multiple 'ERR_NAME_NOT_RESOLVED' errors indicate that the browser is unable to resolve the domain names of the resources being requested. This likely means a DNS resolution issue, either on the client-side or with the server's DNS configuration. Users may experience broken images, failed API calls, or other website functionality issues.

Suggested Fix

Investigate DNS configuration for the affected domains. Verify that DNS records are correctly configured and propagating. Implement robust error handling to gracefully handle resource loading failures.

Why Fix This?

Users may experience degraded functionality or a broken website experience.

Insufficient Color Contrast in Cookie Banner

Priority: 8/10 Confidence: 9/10

WCAG Accessibility Color Contrast

Why is this a bug?

The text in the cookie banner (specifically the 'Learn more' link and 'ALLOW ALL COOKIES' button) has insufficient contrast against the background. This violates WCAG 2.0 AA standards for color contrast (14.3 Contrast (Minimum)). Users with low vision may have difficulty reading the text.

Suggested Fix

Increase the contrast ratio between the text and the background color of the cookie banner elements (links and buttons). This could involve darkening the text color or lightening the background color.

Why Fix This?

Addresses WCAG accessibility guidelines, enhances usability for users with visual impairments, and promotes inclusivity.

CORS Misconfiguration Allows Multiple Origins

Priority: 6/10 Confidence: 8/10

OWASP Cross-Origin Issues

Why is this a bug?

The console log shows a CORS error where the 'Access-Control-Allow-Origin' header contains multiple values ('*', https://smartbear.com'), which is invalid according to CORS standards. This misconfiguration could potentially allow malicious websites to make unauthorized requests on behalf of a user, possibly leading to data leakage or other security breaches. Specifically, the log message states: "Access to fetch at 'https://api.integrate.com/api/v1/display/pixels?publicKey=ml219N9VSYKCKPwYF6a' from origin 'https://smartbear.com' has been blocked by CORS policy: The 'Access-Control-Allow-Origin' header contains multiple values: '*', https://smartbear.com', but only one is allowed. Have the server send the header with a valid value, or, if an opaque response serves your needs, set the request's mode to 'no-cors' to fetch the resource with CORS disabled."

Suggested Fix

Correct the server-side configuration for 'api.integrate.com' to send a single, valid origin in the 'Access-Control-Allow-Origin' header. If multiple origins need to be supported, implement proper origin checking and echo back the request's origin if it's in the allowed list. Alternatively, if the resource doesn't need to be accessed by JavaScript code from other origins, the 'no-cors' mode could be used, though this limits the access.

Why Fix This?

Fixing the CORS misconfiguration is critical to prevent unauthorized cross-origin requests. Leaving it unaddressed can expose the application to potential attacks, like unauthorized data extraction or CSRF-like scenarios.

Invalid Copyright Year

Priority: 9/10 Confidence: 9/10

General Legal

Why is this a bug?

The copyright notice at the bottom of the page reads: "© 2025 SmartBear Software. All Rights Reserved.", which implies the copyright has already been updated for 2025. This is incorrect as the year is only just beginning. Likely this means the year update code rolled out before it was supposed to.

Suggested Fix

Update the copyright notice to reflect the current year (2025).

Why Fix This?

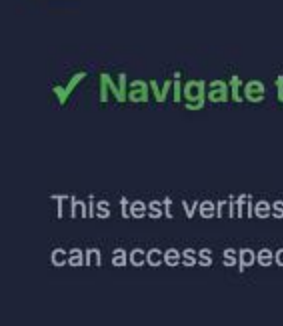

Using an inaccurate date in the copyright notice can create a negative perception.

AI Generated Functional Test Results

Start Page: HOME

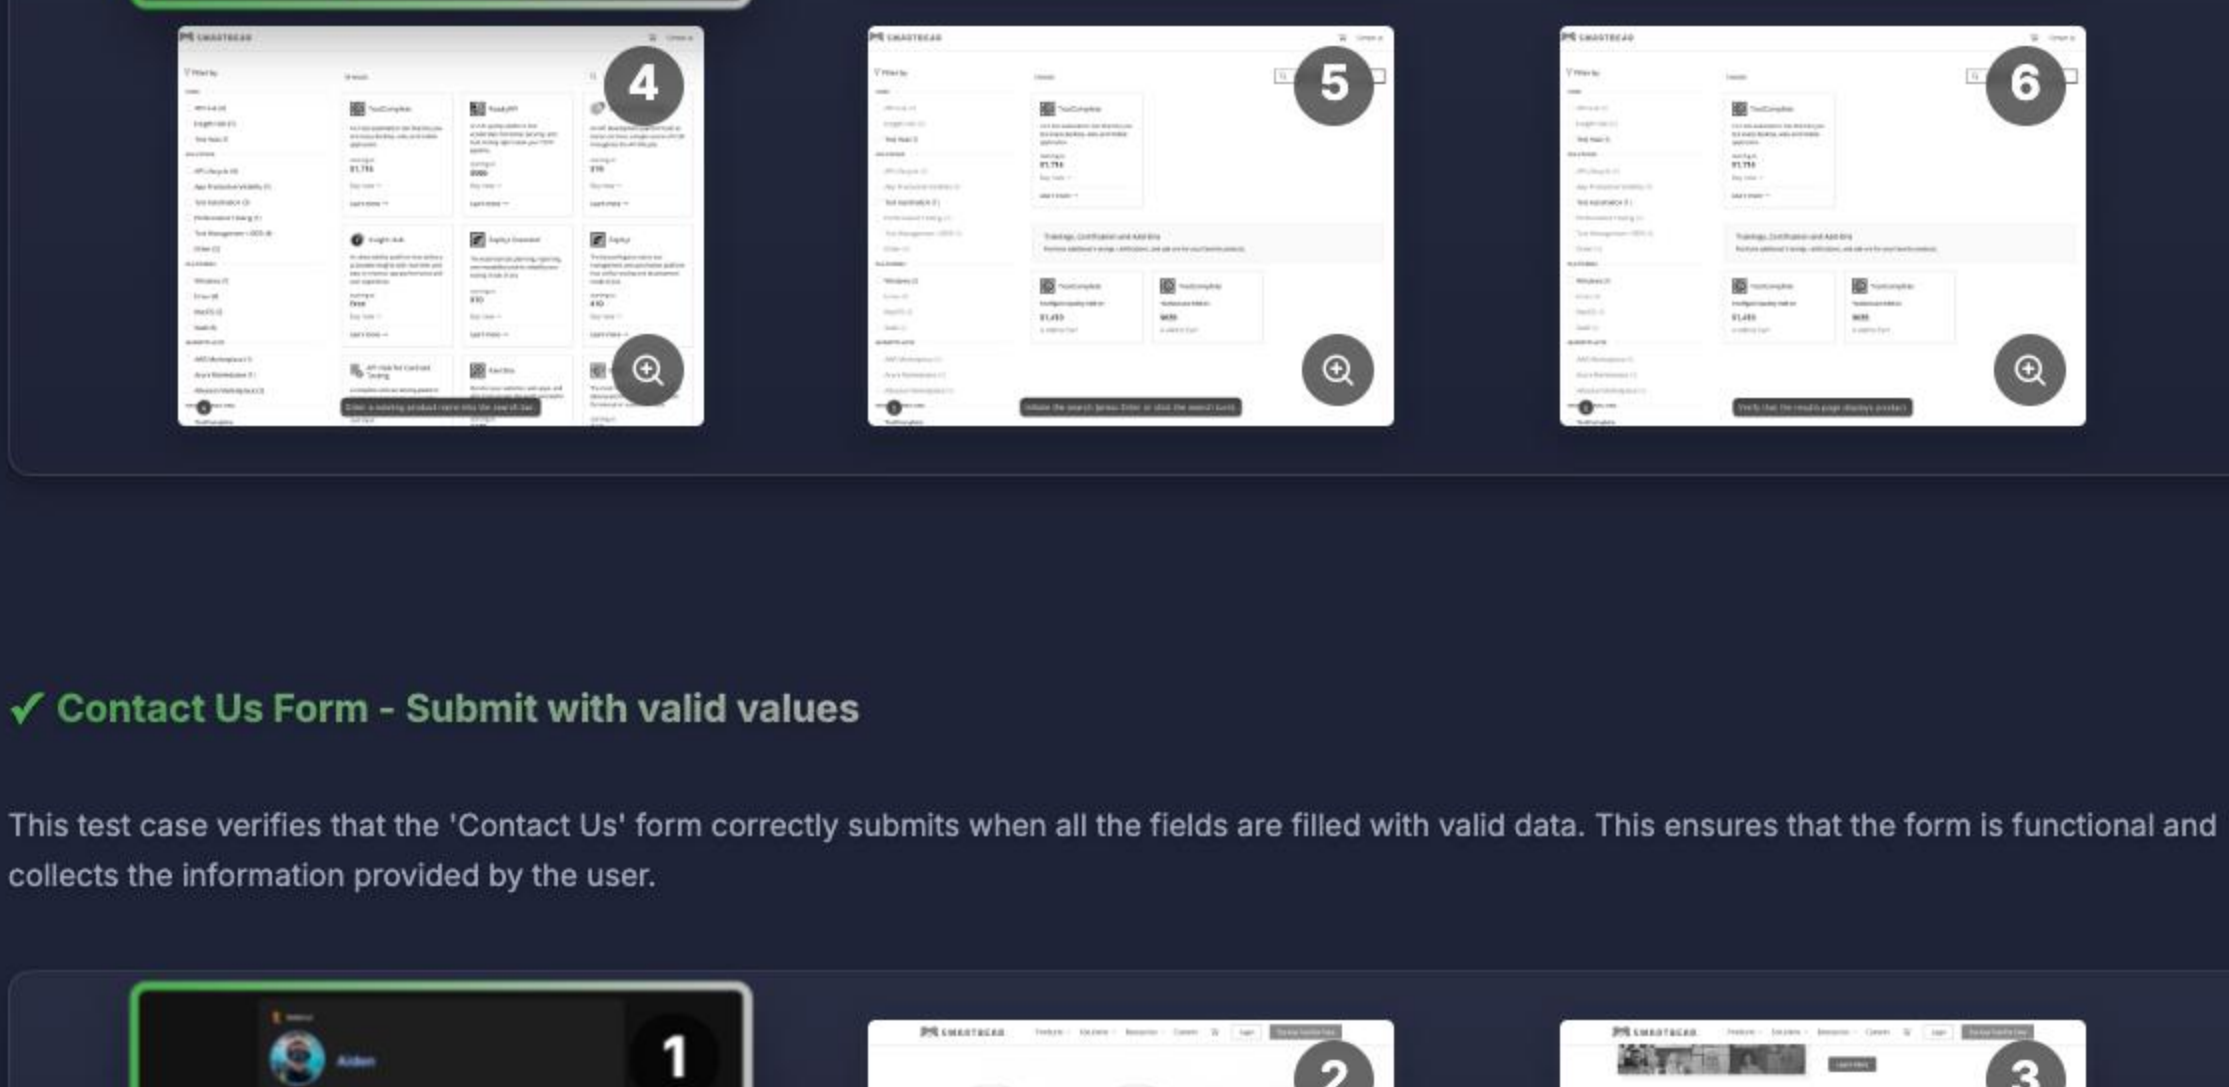

✓ **Navigate to Products -> API Hub and return to homepage**

This test verifies that the navigation to the API Hub page from the Products dropdown and the return to the homepage function correctly. It ensures the user can access specific product information and then easily return to the main landing page.

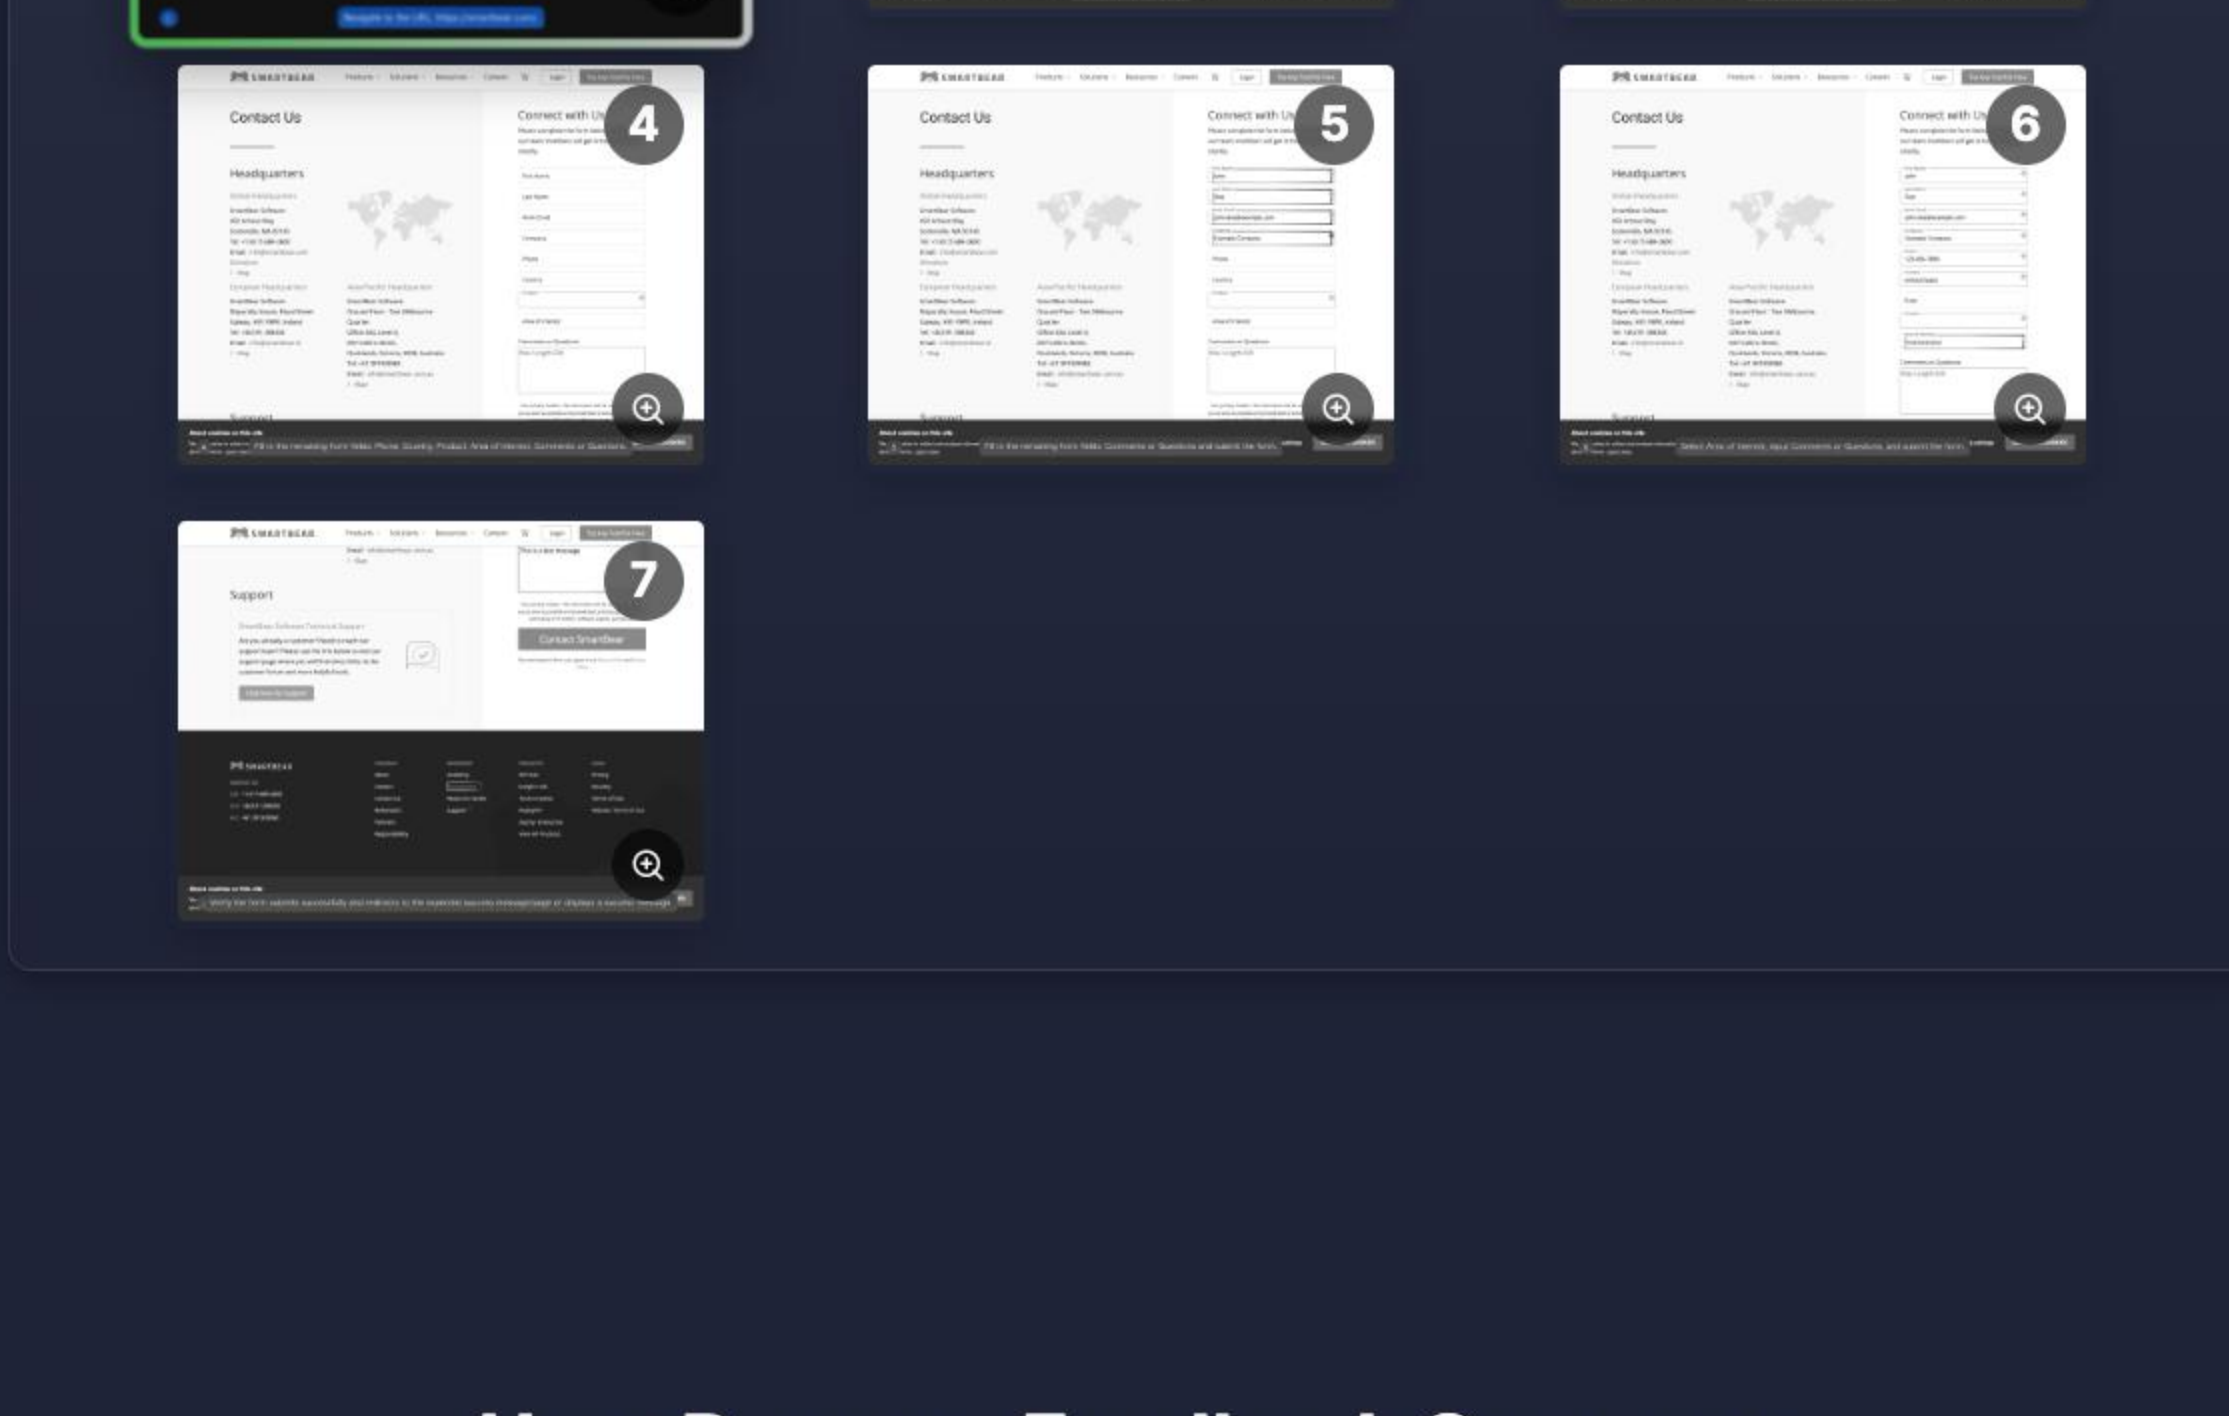

✓ **Search for an existing product and see it displayed.**

This test case verifies that the search functionality can successfully find an existing product. It's important to ensure that the system can find products in its catalog. The expected result is for relevant product to be returned in search results.

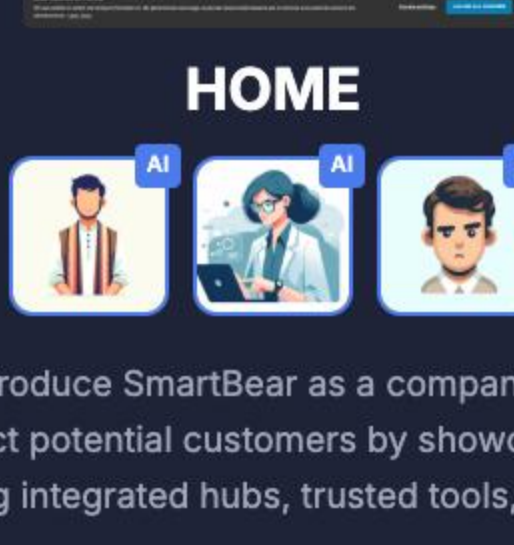

✓ **Contact Us Form - Submit with valid values**

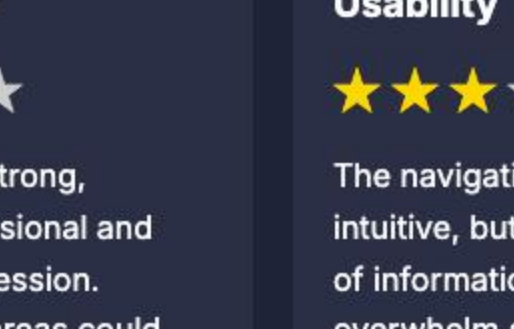

This test case verifies that the 'Contact Us' form correctly submits when all the fields are filled with valid data. This ensures that the form is functional and collects the information provided by the user.

User Persona Feedback Summary

HOME

The webpage is designed to introduce SmartBear as a company providing software quality tools and solutions. It aims to attract potential customers by showcasing their products, solutions, and resources, emphasizing integrated hubs, trusted tools, and unmatched productivity.

<p>Overall Score</p> <p>★★★★★</p> <p>The website is well-designed and informative but could benefit from increased clarity in the value proposition and a more personalized experience. The diverse range of tools and solutions is impressive, but the website could do a better job of guiding users toward the most relevant options based on their specific needs.</p>	<p>Visual Design</p> <p>★★★★★</p> <p>The visuals are strong, creating a professional and trustworthy impression. However, some areas could benefit from more visual cues to guide users through the content.</p>	<p>Usability</p> <p>★★★★★</p> <p>The navigation is generally intuitive, but the sheer volume of information could overwhelm some users. Clearer calls to action and a more streamlined user journey would improve usability.</p>	<p>Content Quality</p> <p>★★★★★</p> <p>The content is informative and well-written, effectively communicating SmartBear's value proposition. However, some sections could benefit from more concise messaging and real-world examples.</p>
